Sowing Instructions

Sow indoors from February to March in pots in a cold greenhouse or in March-May/October-November outdoors. Sow outdoors as soon as there's no risk of frost as the ground is more pliable.

Sow in double rows that are around 7cm deep and 23cm apart. Keep free of weeds and pull out any existing ones before planting.

Provide support on exposed sites prior to the plants reaching 30cm. Harvest the beans when the pods are large and fat.

Days to harvest to maturity

90 days.

Tips

Picking off the tender tips of the shoots can delay and reduce infestation by black bean aphid and can even improve the amount of beans produced.
